

# RENOLIT Ondex

The world leader in the BI-STRETCHED sheet in Polyvinyl Chloride

Rely on it.

## RENOLIT ONDEX BIO sheets

For single layer roofings, sidings and gables for greenhouse applications.

Reference GB11 011 - 10/2016

Modulus of elasticity ISO R 527	32000± 2000 daN/cm <sup>2</sup>						
Breaking stress ISO R 527	700 to 900 daN/cm <sup>2</sup>						
Bending radius	TOG : 3.0 m minimum ; TO : 2.5 m minimum						
Minimum slope	10%						

## The Ten Commandments

 <p>The temperature of the ventilated sheet must not exceed the recommended temperatures.</p>	 <p>Do not exceed the recommended wind conditions.</p>	 <p>Do not install above the recommended altitudes.</p>	 <p>Stability and safety standards for greenhouse construction</p>	 <p>Protect the sheets from sunlight, wind and rain with an opaque white polyethylene tarpaulin during storage and throughout the installation.</p>
 <p>Identify the UV protected side(s)* - 1 or 2 sides.</p>	 <p>Do not step directly on the sheets.</p>	 <p>Drill and use screws and accessories in accordance with the manufacturer's recommendation.</p>	 <p>Check the distance between purlin support centres according to the loads (snow/wind).</p>	 <p>The sheets must not be used to form dual walls over horticultural glass, film or insulating products.</p>

\*The sheet outer side features the product label and a laser marking.

## Behaviour in response to sources of heat

### Storage

Protect the sheets from sunlight, wind and rain with an opaque white polyethylene tarpaulin during storage.

The following precautions must be observed in presence of great sources of heat:

- The **RENOLIT ONDEX BIO** sheets must not be placed in contact with heating pipes or hot-air outlets.
- The sheets must not be placed close to a boiler.
- The projection of incandescent ash (oil fired heating system or coal heating, etc.) should be avoided, since this could cause local burn spots on the sheets.
- Operate the greenhouse (air renewal, etc.) so that the sheet temperature does not exceed 60°C. Incidentally the plants would not survive if subjected to such a treatment (See § III.5)

Do not use any temporary shading system (fabric) or dropped ceiling underneath the **RENOLIT ONDEX BIO** sheets.

Do not place any insulating product, opaque tarpaulin or suspended ceiling directly underneath or very close to the **RENOLIT ONDEX BIO** sheets.

### Storage

On site the pallets can be stacked up to 1 m high (the longest pallet should be at the bottom).

### Installation

The sheets must not be used to form dual walls over horticultural glass, film or insulated products.

### Shading systems

The potential inner shading systems such as nets can be stretched horizontally between the gutters. They must not follow the sheet slope. It is imperative that there is enough space between the sheets and the nets to allow free air circulation and a good ventilation so as to maintain a temperature below 60°C.

To maintain temperatures within the limits set we advise to make an opening on the gables, the tympanums or the ridge.

Regarding greenhouse outer shading systems the nets must be fixed to a dedicated metallic structure. The nets distance must be approx. 40 cm from the gutters and 60 cm from the ridge. The shading nets must under no circumstances be in contact with the **RENOLIT ONDEX BIO** sheets.

### Shading product (lime washing)

The **RENOLIT ONDEX BIO** sheets can be shaded with slaked lime. Other products can be used if they are suitable for PVC. It is recommended to carry out preliminary compatibility tests.

## Cleaning of the sheets

Clean the **RENOLIT ONDEX BIO** sheets with cold or lukewarm water (max. 30°C).

It is possible to use a non-abrasive liquid detergent suitable for PVC. Using a high pressure jet cleaner is possible (150 bar).

It is recommended to clean the **RENOLIT ONDEX BIO** sheets regularly (approx. once a year) or as soon as necessary to guarantee their performances.

### Important:

- Do not use any abrasive or aggressive products for PVC.
- Do never steam clean.
- Do not scrub with brushes, steel wool or any other sharp or abrasive devices.

# The structure

The structures in contact with the **RENOLIT ONDEX BIO** sheets must be a light colour, with an absorption coefficient  $< 0.7$  to prevent any overheating or localized expansion. The timber purlins must be painted white.

The supports in galvanized steel and in aluminium can be left raw.

The section of the secondary frameworks must be established in accordance with the calculation methods for materials

The width of the purlin supports is 25 mm for a metal purlin and 40 mm for a wooden one.

When a glass chapel greenhouse with pitched roof is refurbished, small wooden structural elements must be removed and the greenhouse has to be prepared as previously mentioned.

The bearing surfaces will be flat and parallel. The framework will be perfectly aligned.

### • Standards for load-bearing components

The **RENOLIT ONDEX BIO** sheets must be installed on supporting frame structures in compliance with the technical regulations in force at the time (greenhouse standards, calculation methods for materials).

The **RENOLIT ONDEX BIO** sheets do not contribute to the stability of greenhouses: it is left to the bearing structure.

### • Anchoring to the ground

The greenhouse resistance to snow (pressure) and wind (depression) loads must be guaranteed by the framework and its anchor regardless of the sheets.

### • Greenhouse framework and structure

The **RENOLIT ONDEX BIO 2** sheets are installed on purlins or struts.

The secondary structure must be aligned with or above (never underneath) the curve or angle of the main structure.

Fastening type A - B - C - E

Fastening type D fastening with pressure bar

### • The loads

**Snow downward loads** for a deflection equal to  $1/50^{\text{th}}$  of the span, safety factor = 3 for an overlap: 1 or 2 corrugations (load in  $\text{daN/m}^2$  - distance between purlin support centres in cm)
